Spotify Stats

Research, Innovation Scholaship and Enterprenuership | Georgian

"Your data. Their platform. We changed that."

about us

Spotify Stats is an automated data pipeline that captures your Spotify listening history every hour and stores it permanently in an analytical database. Built on Apache Airflow, ClickHouse, and Docker, it transforms raw play events into a live dashboard surfacing your top songs, artists, albums, and listening trends in real time. No manual input. No lost data. Every play, preserved.

Spotify knows everything about what you listen to, But they won't tell you.

Criterion 1 – Originality & Innovation

ONCE A YEAR

Spotify Wrapped release once year. The other 364 days?, your data is locked away.

NO ACCESS

you can't filter your history, search by date, or ask 'What did I listen to the most last month?'

NO INSIGHTS

There's no way to see trends in your listening behaviour, who your top artist are week by week.

How we Build it

No duplicates ever

Built-in chat, voice, and notification system keeps everyone aligned.

never needs to log in again

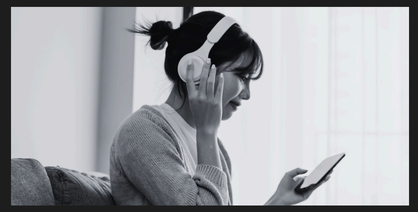
Real-time editing, comments, and task updates across departments.

It fixes itself when something wrong

Automatic saving and synchronization across devices and teams.

Everything runs in isolated containers

Drag-and-drop automation for routine tasks, saving time and effort.



Our Solution

Think of it like a postal worker who automatically picks up your mail every hour, sorts it, files it, and builds you a report without you ever asking.

9 INDUSTRY, INNOVATION AND INFRASTRUCTURE

10 REDUCED INEQUALITIES

17 PARTNERSHIPS FOR THE GOALS

Why this Matter

INNOVATION & INFRASTRUCTUR **SDG 9**

We build a production-grade system,the same type used by real data companies, using only free, open source tools

REDUCED INEQUAILITIES **SDG 10**

Anyone can own and understand their personal data, not just tech giants. We put that power on your hands.

PARTNERSHIPS & SHARING **SDG 17**

every tool we used is open source and can be reused by others researchers, students, and communities worldwise.

BIGGER PICTURE

The same approach we used for music data can be applied to:

Hospitals

Track patient vitals & activity data over time

Logistics

Monitor shipment and delivery trends

Retail

understand what customers buy and when

Finance

Detect pattern in transcatioins automatically

We didn't just write code, We built something that runs itself.

A real system. Real data. Real insights, delivered every hour, automatically.

CHALLENGES WE OVERCOME

CHALLENGES

How do you keep a system logged in to an app forever?

SOLUTION

We set up a one-time secure connection that automatically renews itself. The system never needs to be manually logged in again.

CHALLENGES

What if the same song gets downloaded twice?

SOLUTION

Our database is smart enough to recognize duplicates and ignore them automatically. Your history stays clean with no extra effort.

CHALLENGES

How do six different programs talk to each other reliably?

SOLUTION

We built them into a shared private network like offices in the same building connected by an intercom system.

CHALLENGES

What happens if something breaks at 3am?

SOLUTION

The system tries to fix itself automatically. If it can't, it sends an email alert. No one needs to be watching it 24/7.
